

ABSTRACT OF THE DISCLOSURE

A method and system for reducing a probability of a negative outcome of applying over a population, of a pharmaceutically active product, the method comprising: obtaining data including dosage data of applications and corresponding results, and analytically processing said data to relate dosage data to subgroupings within said population, thereby to arrive at a safe dosage recommendation of said pharmaceutically active product for at least one of said subgroupings, said safe dosage level recommendation being arrived at to minimize said probability of a negative outcome.
